You are the right person for our group

• If you are good at four core practices of computer science
  • programming,
  • systems thinking,
  • modeling, and
  • innovation.

• If you
  • can dream,
  • can do, and
  • can write.
My research focuses on building algorithms for analyzing biological data using various biochemical networks. Even though it took 13 years and ~$1b to sequence the first genome, right now, it takes a day and ~$1k. This has resulted in accumulation of vast amounts of information. Consequently, biosciences have faced the problem of “big data”. Today, the bottleneck in the bio-research is the lack of computational power and algorithms that can efficiently analyze the data and make discoveries. Central dogma in molecular biology dictates the information flow from DNA --> RNA --> Protein --> Metabolite. Each layer introduces 20k, 100k, 1m, and 3k variables respectively. The search space for even a basic pattern discovery is clearly intractable. I design machine learning algorithms that use biological networks to prune the search space and discover biomarkers in particular for genetic Diseases.
Gene Discovery for Autism Spectrum Disorder
-Broken interplay between 1000 genes lead to autism.
-So far we have only discovered \(~50\) of them, Biological networks along with intelligent search algorithms needed to discover new genes to understand the genetic architecture.
Using Dynamic Network Algorithms to Model Neurodevelopment.

- Autism is a neurodevelopmental disorder and affects evolving the gene interaction networks of the fetal period to early childhood.
- We design algorithms that analyze the dynamic networks to understand the functionality autism affects.
Metabolic Networks to Understand Cancer

Metabolites are small compounds in the body that have been found to be key biomarkers to subtypes of the same cancer. We use certain network analysis systems to define tumors and analyze the metabolic differences within subtypes of the same cancer. We define tumors to be compounds in the body.
Selected Publications:

- **De Novo Chip-Seq Analysis. Genome Biology** 2015, 16:205.

- **DAWN: A framework to identify autism genes and subnetworks using gene expression and genetics**

I work in the fields of Affective Computing, Computer Vision, and Pattern Recognition.

My current research mainly focuses on multimodal analysis of non-verbal human behavior (e.g. face analysis, gesture recognition, etc.) and deep learning of temporal representations.

Mining Software Engineering data

Identifying Key Developers using Artifact Traceability Graphs

Analyzing Developer Contributions using Artifact Traceability Graphs

H. Alperen Çetin, Eray Tüzün
Bilkent University
Ankara, Turkey

Abstract
Software artifacts are the by-products of the development process. Throughout the life cycle of a project, developers produce different artifacts such as source files and bug reports. To analyze developer contributions, we construct artifact traceability graphs with these artifacts and their relations using the data from software development and collaboration tools.

Learning Visual Similarity for Image Retrieval with Convolutional Neural Networks

- Finding matching images across large and unstructured dataset plays a key role in many computer vision applications.
- An image retrieval system enables searching and retrieving images from a large dataset of images.
- The aim is learning efficient visual similarity for image retrieval task by revealing resemblances and differences between product images using triplet networks empowered with global descriptors, revised capsule networks, spatial group-wise enhance, and self-attention layer in an end-to-end manner.
