Structural variation discovery with HTS data

- SVs: genomic alterations > 50 bp.
 - Databases:
 - dbVar: http://www.ncbi.nlm.nih.gov/dbvar/
 - DGV: http://projects.tcag.ca/variation/
- Input: sequence data and reference genome
- Output: set of SVs and their genotypes (homozygous/heterozygous)
- Often there are errors, filtering required
- SV detection methods can be based on statistical analysis or combinatorial optimization
- Tools:
 - Illumina: TARDIS, LUMPY, DELLY, Manta, TIDDIT, Genome STRiP, etc.
 - Long reads: Sniffles, cuteSV, etc.

Challenges

- Most SVs are embedded within or around segmental duplications or long repeats
 - □ If you use unique mapping, you will lose sensitivity
 - Ambiguous mapping of reads will increase false positives
 - Reference genome is incomplete; missing portions are duplications which cause more problems in accurate detection
- Many SVs are complex; many rearrangements at the same site
- CNV discovery is heavily studied but still not perfect; detection of balanced rearrangements are still problematic

Duplications and CNV hotspots

Gains & Losses > 5 Kbp in the same 5 individuals

Kidd et al. Cell, 2010

Sequencing technologies

Short-Read Illumina

- 100-200bp
- Pairedend
- Billions of reads
- < 0.1% error

Long Read

PacBio and Oxford Nanopore

- > 10 Kb, up to 1 Mb
- Single-end
- Hundreds of millions of reads
- 12-20% error indel dominated

Long Range

10X + Illumina

- 100-200bp
- Paired-end
- Billions of reads
- < 0.1% error
- Barcoded: 30-50
 Kb molecule

Sequence signatures of structural variation

- Read pair analysis
 - Deletions, small novel insertions, inversions, transposons
 - Size and breakpoint resolution dependent to insert size
- Read depth analysis
 - Deletions and duplications only
 - Relatively poor breakpoint resolution
- Split read analysis
 - Small novel insertions/deletions, and mobile element insertions
 - Ibp breakpoint resolution
- Local and *de novo* assembly
 - SV in unique segments
 - 1bp breakpoint resolution

Read Depth

Jeffrey A. Bailey,¹ Zhiping Gu,² Royden A. Clark,¹ Knut Reinert,² Rhea V. Samonte,¹ Stuart Schwartz,¹ Mark D. Adams,² Eugene W. Myers,² Peter W. Li,² Evan E. Eichler^{1*}

Science, 2002

genetics

Genome Research, 2006

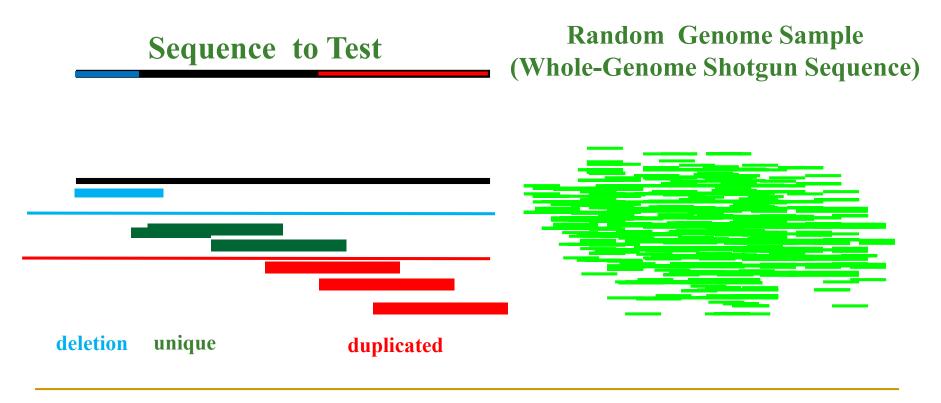

All these first algorithms used Sanger sequence, but laid out the basic principles for HTS analysis

Read depth based algorithms

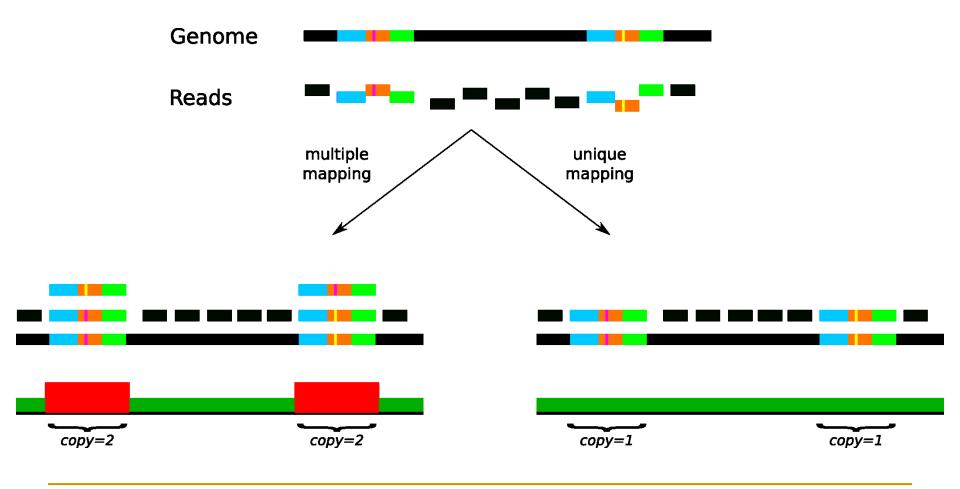

- Assume random (Poisson) distribution in read depth
- Multiple mapping:
 - WSSD (whole genome shotgun sequence detection)
- Unique mapping:
 - Low resolution: Campbell et al. Nat Genet 2008, Chiang et al. Nat Meth, 2009 (SegSeq)
 - High(er) resolution: CNVnator, EWT (RDXplorer)

Read depth analysis: WSSD

- Uses database of random reads to confirm duplicated nature of the sequence
 - increased # of copies => increased number of reads
 - decreased # of copies => decreased number of reads
- Compute depth-of-coverage in 5kb windows (sliding by 1kb); select regions with increased depth as duplications, regions with reduced depth as deletions (WSSD method)

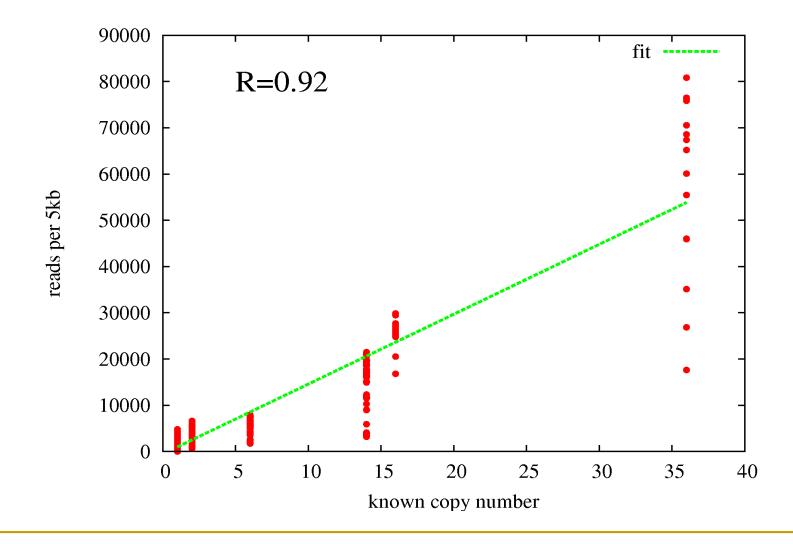

Multiple vs. unique mapping

Modified from Chiang & McCarroll, Nat Biotech, 2009

Read depth - Copy number correlation

Alkan et al., Nature Genetics, 2009

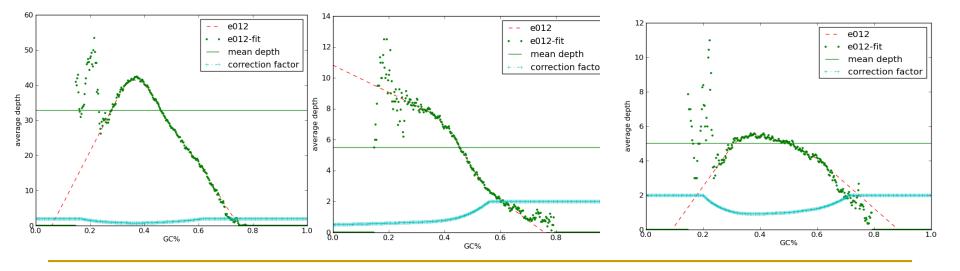

WSSD-HTS: mrCaNaVaR

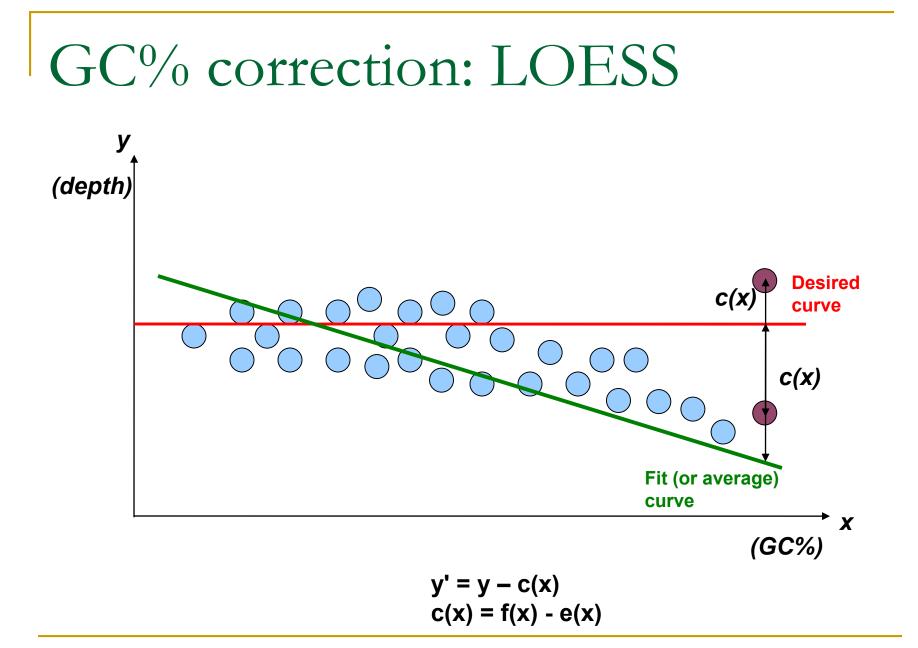

HTS specific problems

- Short reads: MegaBLAST is replaced by mrFAST / mrsFAST
- Common repeats: all repeats need to be masked
- GC % bias needs to be fixed
- Improvement
 - Absolute copy number detection in 1 kb nonoverlapping windows
 - Genotyping highly identical paralogs

Read depth distribution

- Read depth doesn't really follow Poisson distribution
 - Biases against high and low GC %

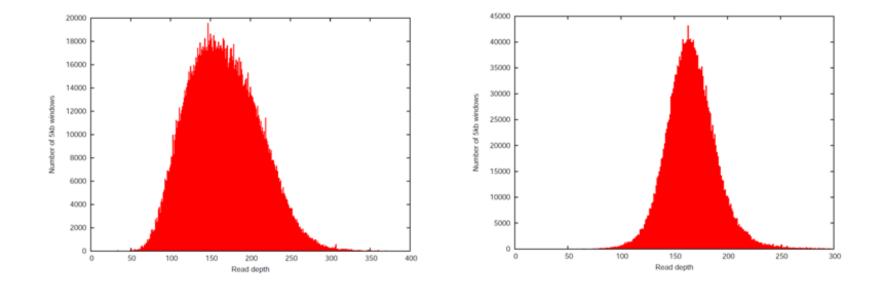

GC% correction (modified LOESS)

$$k_{gc} = \mu_{total} / \mu_{gc}$$

$$d'_{gc} = d_{gc}k_{gc}$$

The version in SegSeq and CNVnator

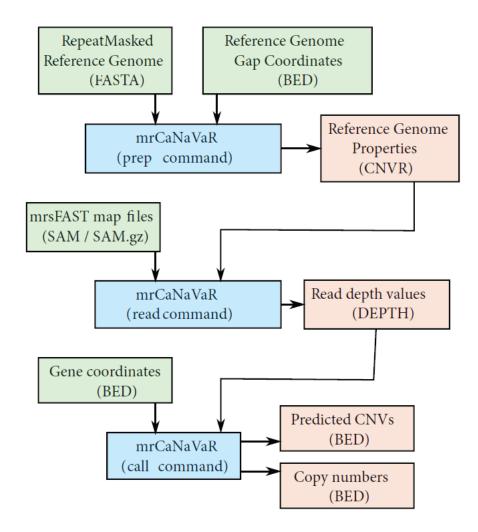

GC% correction

Before GC correction

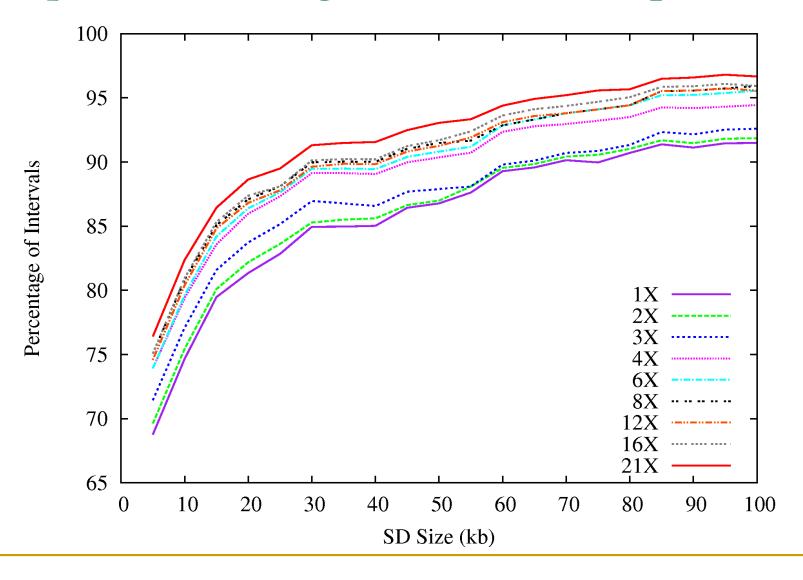

After GC correction

WSSD-HTS: mrCaNaVaR

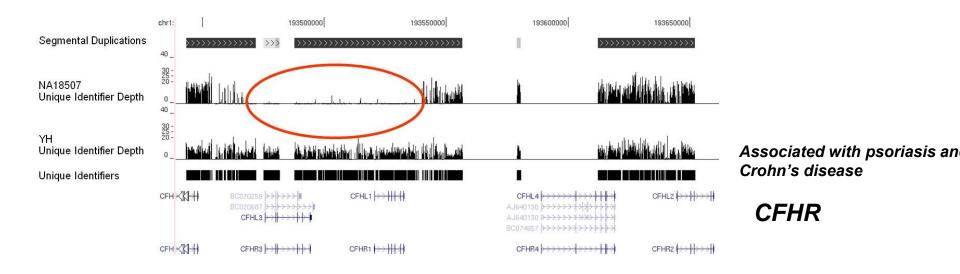

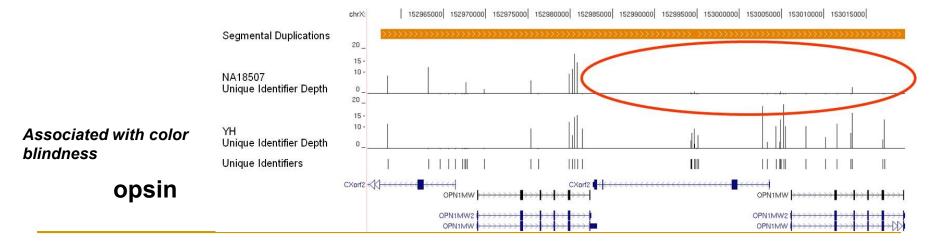

Alkan et al., Nat Genet, 2009

Sequence coverage and detection power

Differentiating Paralogous Genes

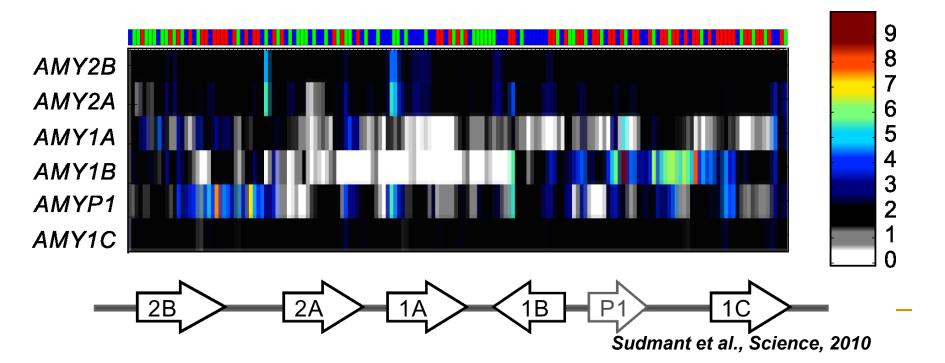

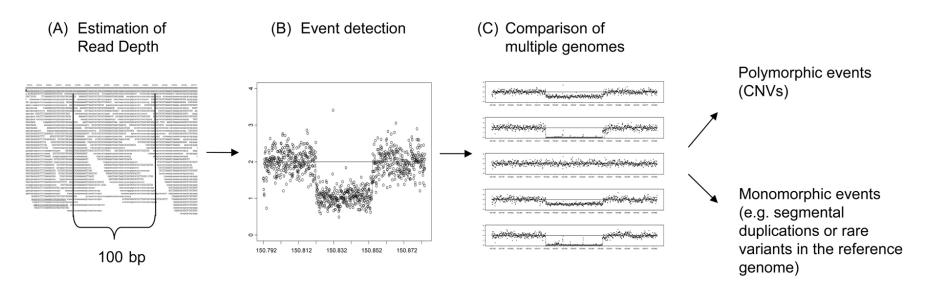

Alkan et al., Nature Genetics, 2009

Singly Unique Identifiers (SUNs)

- Copy 1 ATACTAGGCATATAATATCCGACGATATACATATAGATGTTAG
- Copy 2 ATGCTAGGCATGTAATATCCGACGACATACATATACATGTTAG
- Copy 3 ATACTAGGCATATAACATCCGACGATATACATATACATGTTAG
- Copy 4 ATGCTACGCATATAATATCCCACGATATACATATACATGTTAG
- Copy 5 ATGCTACGCATATAATATCCGACGATATACATATACATGATAG
- Copy 6 ATACTAGGCATGTAATATCCGACGATATAC- ATACATGTTAG

Event-Wise Testing (EWT)

- Unique mappings are used
- No masking
- Window size 100 bp
- Probabilistic analysis

Event-Wise Testing (EWT)

Read counts are converted to Z score:

 $\Box \quad z_i = (RC_i - \mu_i) / \sigma_i$

Upper and lower tail probabilities

$$\neg p_i^{\cup} = P(Z > z_i)$$

$$\square p_i^L = P(Z \le z_i)$$

Unusual events for interval A, I = |A|; L number of windows in chromosome; FPR: false positive rate

$$\max\{p_i^U \mid i \in A\} < \left(\frac{FPR}{L/l}\right)^{\frac{1}{l}} \qquad \max\{p_i^L \mid i \in A\} < \left(\frac{FPR}{L/l}\right)^{\frac{1}{l}}$$

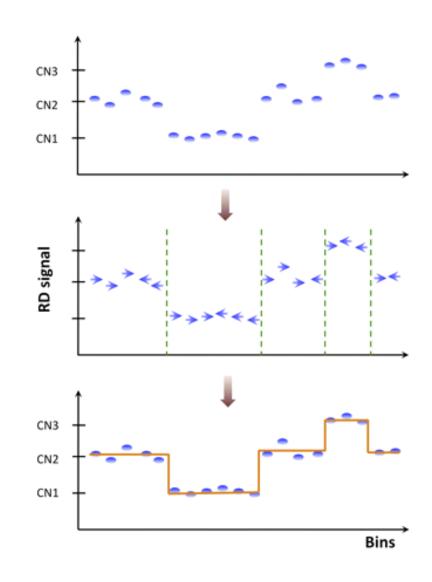

Duplication

Deletion

Yoon et al. Genome Research, 2009

CNVnator

- Unique mappings
- Mappings with low MAPQ are discarded
- Partitioning is based on mean-shift technique developed for image processing

Abyzov et al. Genome Research, 2011

CNVs with exome sequencing

- Exome sequencing: capture only coding exons from DNA and sequence
 - 1.5% of total genome
 - Good for protein coding variants but misses regulatory sequence, introns, etc.
- Whole genome sequencing generates random data, but exome does not
- Capture efficiency changes for every exon (n~200,000)
- CNVs from exomes: ExomeCNV, FREEC, CoNIFER
