

Introduction to MATLAB

MATrix LABoratory

- First introduced at Stanford University in 1979
- Initially an interactive shell to FORTRAN routines
- MathWorks was formed to market Matlab
- Powerful engineering environment and language
- Useful for problem solving, data analysis, modeling and visualization
- Runs on nearly every operating system

MATrix LABoratory

- <http://www.mathworks.com>
- Advantages of MATLAB
 - Ease of use
 - Platform independence
 - Predefined functions
 - Plotting
- Disadvantages of MATLAB
 - Can be slow
 - Expensive

Command History

- 25/09/2013 15:28
- 01/11/2013 10:49

Ready

MATLAB Basics

- A program can be input
 - command by command using the command line (lines starting with “>>” on the MATLAB desktop)
 - as a series of commands using a file (a special file called **M-file**)
- If a command is followed by a semicolon (;), result of the computation is not shown on the command window

MATLAB Basics: Getting Help

- **help**
 - help *toolbox* → e.g., help elfun
 - help *command* → e.g., help sin
- **helpdesk, helpwin, “?”** button
- **lookfor**
 - lookfor *keyword* → e.g., lookfor cotangent

MATLAB Basics: Special Values

- **pi**: π value up to 15 significant digits
- **i, j**: $\sqrt{-1}$
- **Inf**: infinity (such as division by 0)
- **NaN**: Not-a-Number (such as division of zero by zero)
- **clock**: current date and time as a vector
- **date**: current date as a string (e.g. 17-Nov-2008)
- **eps**: epsilon
- **ans**: default variable for answers

MATLAB Basics: Variables

Let's evaluate the following expression in matlab :

$$\cot(3)\sqrt{(\log(3))^3} + \cos(3) * \sin(\log(3))$$

Now let's do the following:

$$\cot(2.7)\sqrt{(\log(2.7))^3} + \cos(2.7) * \sin(\log(2.7))$$

What if we need to evaluate the same expression for 2.1, 2.2, 2.3, ... and lots of other values?

MATLAB Basics: Variables

■ Given: $\cot(3)\sqrt{(\log(3))^3} + \cos(3)*\sin(\log(3))$

Rather than :

```
>>cot(3)*sqrt(log(3)^3) + cos(3)*sin(log(3)),
```

```
>>cot(2.7)*sqrt(log(2.7)^3) + cos(2.7)*sin(log(2.7)), ...
```

Use a variable:

```
>>x=3
```

```
>>cot(x)*sqrt(log(x)^3) + cos(x)*sin(log(x))
```

```
>>x=2.7
```

```
>>cot(x)*sqrt(log(x)^3) + cos(x)*sin(log(x))
```

MATLAB Basics: Variables

- **Variable** is a name given to a reserved location in memory
 - `class_code = 111;`
 - `number_of_students = 65;`
 - `name = 'Bilkent University';`
 - `radius = 5;`
 - `area = pi * radius^2;`

MATLAB Basics: Variables

- Use meaningful names for variables
- MATLAB variable names
 - must begin with a letter
 - can contain any combination of letters, numbers and underscore (_)
 - must be unique in the first 31 characters
- MATLAB is case sensitive: "name", "Name" and "NAME" are considered different variables
- Never use a variable with the same name as a MATLAB command
- Naming convention: use lowercase letters

MATLAB Basics

- The fundamental unit of data is **array**

column

3

scalar value

row →

1	40	-3	11
---	----	----	----

vector

15	-2	3	21
-4	1	0	13

matrix

MATLAB Basics: Arrays

- Initialization using assignment statements
- Assignment is always in form of variable equals expression or a constant

- $x = 5$

```
x =  
    5
```

- $y = x + 1$

```
y =  
    6
```

- $v = [1 2 3 4]$

```
v =  
    1    2    3    4
```

- $m = [1 2 3; 4 5 6]$

```
m =  
    1    2    3  
    4    5    6
```

- $m2 = [1 2 3; 4 5]$

??? Error

- $a = [5 (2+4)]$

```
a =  
    5    6
```

MATLAB Basics: Arrays

- Initialization using shortcut statements

- colon operator → **first:increment:last**

- `x = 1:2:10`

- `x =`

- 1 3 5 7 9

- `y = 0:0.1:0.5`

- `y =`

- 0 0.1 0.2 0.3 0.4 0.5

MATLAB Basics: Arrays

- Initialization using built-in functions

- **zeros()**

- `x = zeros(2)`

- `x =`

- | | |
|---|---|
| 0 | 0 |
| 0 | 0 |

- `z = zeros(2,3)`

- `z =`

- | | | |
|---|---|---|
| 0 | 0 | 0 |
| 0 | 0 | 0 |

- `y = zeros(1,4)`

- `y =`

- | | | | |
|---|---|---|---|
| 0 | 0 | 0 | 0 |
|---|---|---|---|

- `t = zeros(size(z))`

- `t =`

- | | | |
|---|---|---|
| 0 | 0 | 0 |
| 0 | 0 | 0 |

- **ones(), size(), length()**

MATLAB Basics: Subarrays

- Array indices start from 1

- `x = [-2 0 9 1 4];`

- `x(2)`

- `ans =`
`0`

- `x(4)`

- `ans =`
`1`

- `x(8)`

- `??? Error`

- `x(-1)`

- `??? Error`

MATLAB Basics: Subarrays

- $y = [1 \ 2 \ 3; 4 \ 5 \ 6];$
 - $y(1,2)$
ans =
2
 - $y(2,3)$
ans =
6

MATLAB Basics: Subarrays

■ `y = [1 2 3; 4 5 6];`

■ `y(1,:)`

`ans =`

1 2 3

■ `y(:,2)`

`ans =`

2

5

■ `y(2,1:2)`

`ans =`

4 5

■ `y(1,2:end)`

`ans =`

2 3

■ `y(:,2:end)`

`ans =`

2 3

5 6

MATLAB Basics: Subarrays

■ $x = [-2 \ 0 \ 9 \ 1 \ 4];$

■ $x(2) = 5$

$x =$

-2 5 9 1 4

■ $x(4) = x(1)$

$x =$

-2 5 9 -2 4

■ $x(8) = -1$

$x =$

-2 5 9 -2 4 0 0 -1

MATLAB Basics: Subarrays

■ $y = [1 \ 2 \ 3; 4 \ 5 \ 6];$

■ $y(1,2) = -5$

$y =$

1	-5	3
4	5	6

■ $y(2,1) = 0$

$y =$

1	-5	3
0	5	6

■ $y(1,:) = [4 \ -1 \ 9]$

$y =$

4	-1	9
0	5	6

■ $y(:,2) = [3; 2]$

$y =$

4	3	9
0	2	6

MATLAB Basics: Subarrays

- $z = [1 \ 2 \ 3; 4 \ 5 \ 6; 7 \ 8 \ 9];$

- $z(3,:) = 0$

$z =$

1	2	3
4	5	6
0	0	0

- $z(:,1) = -2$

$z =$

-2	2	3
-2	5	6
-2	0	0

- $z(2,:) = [1 \ 5]$

??? Error

Subarray examples

- $A(1:4,3)$ is the column vector consisting of the first four entries of the third column of A
- $A(:,3)$ is the third column of A □
- $A(:, [2\ 4])$ contains as columns, columns 2 and 4 of A
- Such subscripting can be used on both sides of an assignment statement
- $A(:, [2\ 4\ 5]) = B(:, 1:3)$ replaces columns 2, 4 and 5 of A with the first three columns of B .

MATLAB Basics: Addressing Arrays by using a Colon

- $Va(:)$ refers to all the elements of the vector Va
- $Va(m:n)$ refers to elements m through n of the vector Va
- $A(:,n)$ refers to the elements in all the rows of column n of the matrix A
- $A(n,:)$ refers to the elements in all the columns of row n of the matrix A
- $A(:,m:n)$ refers to the elements in all the rows between columns m through n of the matrix A
- $A(m:n,:)$ refers to the elements in all the columns between rows m through n of the matrix A
- $A(m:n,p:q)$ refers to the elements in rows m through n and columns p through q of the matrix A

Built-in Functions for Arrays

Function	Description	Example
mean(A)	Returns mean value of vector A	>>A=[5 9 4 2]; >>mean(A) Ans= 5
C=max(A) [d,n]=max(A)	C is largest element of vector A d is largest element of vector A, n is position of element	>>A=[5 9 2 4 11 6 7 11]; >>C=max(A) C= 11 >>[d,n]=max(A) d=11 n=5
C=min(A) [d,n]=min(A)	C is smallest element of vector A The same as [d,n]= max(A),butfor smallest element	>>A=[5 9 4 2]; >>min(A) Ans= 2
sum(A)	Returns sum of elements of vector A	>>A=[5 9 4 2]; >>sum(A) Ans= 20

Built-in Functions for Arrays (cont.)

Function	Description	Example
sort(A)	Arranges elements of vector in ascending order	>>A=[5 9 4 2]; >>sort(A) Ans= 2 4 5 9
det(A)	Returns determinant of square matrix A	>>A=[2 4 ; 3 5]; >>det(A) Ans= -2
inv(A)	Returns inverse of a square matrix	>>A=[2 -2 1; 3 2 -1; 2 -3 2] >>inv(A) Ans= 0.2000 0.2000 0 -1.6000 0.4000 1.000 -2.6000 0.4000 2.000
dot(a,b)	Calculates scalar product of two vectors a and b	>>a=[1 2 3]; >>b=[2 4 1]; >>cross(a,b) Ans= -5 3 2

MATLAB Basics: Scalar Operations

- *variable_name = expression;*

- addition $a + b$ \rightarrow $a + b$
- subtraction $a - b$ \rightarrow $a - b$
- multiplication $a \times b$ \rightarrow $a * b$
- division a / b \rightarrow a / b
- exponent a^b \rightarrow $a \wedge b$

MATLAB Basics: Scalar Operations

- $x = 3 * 2 + 6 / 2$

- $x = ?$

- Processing order of operations is important

- parenthesis (starting from the innermost)

- exponentials (left to right)

- multiplications and divisions (left to right)

- additions and subtractions (left to right)

- $x = 3 * 2 + 6 / 2$

- $x = 9$

MATLAB Basics: Built-in Functions

- *result = function_name(input);*
 - abs, sign
 - log, log10, log2
 - exp
 - sqrt
 - sin, cos, tan
 - asin, acos, atan
 - max, min
 - round, floor, ceil, fix
 - mod, rem
- help elfun

Rounding functions

Function	Description	Example
<code>round(x)</code>	Round to nearest integer	<code>>>round(17/5)</code> Ans= 3
<code>fix(x)</code>	Round towards zero	<code>>>fix(13/5)</code> Ans= 2
<code>ceil(x)</code>	Round towards infinity	<code>>>ceil(11/5)</code> Ans= 3
<code>floor(x)</code>	Round towards minus infinity	<code>>>floor(-9/4)</code> Ans= -3
<code>rem(x,y)</code>	Returns remainder after x is divided by y	<code>>>rem(13,5)</code> Ans= 3
<code>sign(x)</code>	Signum function 1 if $x > 0$, -1 if $x < 0$, 0 if $x = 0$	<code>>>sign(5)</code> Ans= 1

MATLAB Basics: Debugging

- Syntax errors
 - Check spelling and punctuation
- Run-time errors
 - Check input data
 - Can remove ";" or add "disp" statements
- Logical errors
 - Use shorter statements
 - Check typos
 - Check units
 - Ask your friends, TAs, instructor, parents, ...

MATLAB Basics: Useful Commands

- `help command` → Online help
- `lookfor keyword` → Lists related commands
- `which` → Version and location info
- `clear` → Clears the workspace
- `clc` → Clears the command window
- `diary filename` → Sends output to file
- `diary on/off` → Turns diary on/off
- `who, whos` → Lists content of the workspace
- `more on/off` → Enables/disables paged output
- `Ctrl+c` → Aborts operation
- `...` → Continuation
- `%` → Comments
