### Graph Searching: Depth-First Search and Topological Sort

# Depth-First Search

---

- Graph  $G=(V,E)$  directed or undirected
- Adjacency list representation
- **Goal**: Systematically explore every vertex and every edge
- **Idea**: search deeper whenever possible
  - Using a LIFO queue (Stack; FIFO queue used in BFS)

# Depth-First Search

---

- Maintains several fields for each  $v \in V$
- Like BFS, **colors** the vertices to indicate their states. Each vertex is
  - Initially **white**,
  - **grayed** when discovered,
  - **blackened** when finished
- Like BFS, records **discovery** of a white  $v$  during scanning **Adj**[ $u$ ] by  $\pi[v] \leftarrow u$

# Depth-First Search

---

- Unlike BFS, predecessor graph  $G_\pi$  produced by DFS forms **spanning forest**
- $G_\pi = (V, E_\pi)$  where
$$E_\pi = \{(\pi[v], v) : v \in V \text{ and } \pi[v] \neq \text{NIL}\}$$
- $G_\pi$  = depth-first forest (DFF) is composed of disjoint depth-first trees (DFTs)

# Depth-First Search

- DFS also timestamps each vertex with two **timestamps**
- $d[v]$ : records when  $v$  is first discovered and **grayed**
- $f[v]$ : records when  $v$  is finished and **blackened**
- Since there is only one discovery event and finishing event for each vertex we have  $1 \leq d[v] < f[v] \leq 2|V|$

Time axis for the color of a vertex

# Depth-First Search

## DFS(*G*)

**for each**  $u \in V$  **do**

$\text{color}[u] \leftarrow \text{white}$

$\pi[u] \leftarrow \text{NIL}$

$\text{time} \leftarrow 0$

**for each**  $u \in V$  **do**

**if**  $\text{color}[u] = \text{white}$  **then**

        DFS-VISIT(*G*,  $u$ )

## DFS-VISIT(*G*, $u$ )

$\text{color}[u] \leftarrow \text{gray}$

$d[u] \leftarrow \text{time} \leftarrow \text{time} + 1$

**for each**  $v \in \text{Adj}[u]$  **do**

**if**  $\text{color}[v] = \text{white}$  **then**

$\pi[v] \leftarrow u$

            DFS-VISIT(*G*,  $v$ )

$\text{color}[u] \leftarrow \text{black}$

$f[u] \leftarrow \text{time} \leftarrow \text{time} + 1$

# Depth-First Search

---

- Running time:  $\Theta(V+E)$
- Initialization loop in **DFS** :  $\Theta(V)$
- Main loop in **DFS**:  $\Theta(V)$  exclusive of time to execute calls to **DFS-VISIT**
- **DFS-VISIT** is called exactly once for each  $v \in V$  since
  - **DFS-VISIT** is invoked only on white vertices and
  - **DFS-VISIT**(**G**,  $u$ ) immediately colors  $u$  as gray
- For loop of **DFS-VISIT**(**G**,  $u$ ) is executed  $|\text{Adj}[u]|$  time
- Since  $\sum |\text{Adj}[u]| = E$ , total cost of executing loop of **DFS-VISIT** is  $\Theta(E)$
