Randomized Quicksort

- In the avg-case analysis, we assumed that all permutations of the input array are equally likely.
 But, this assumption does not always hold
 e.g. What if all the input arrays are reverse sorted?
 Always worst-case behavior
- Ideally, the avg-case runtime should be independent of the input permutation.
- Randomness should be within the algorithm, not based on the distribution of the inputs.

i.e. The avg case should hold for all possible inputs

CS 473 – Lecture 6-b

Randomized Algorithms

□ Alternative to assuming a uniform distribution:

→ Impose a uniform distribution

e.g. Choose a random pivot rather than the first element

□ Typically useful when:

- there are many ways that an algorithm can proceed
- but, it's difficult to determine a way that is always guaranteed to be good.
- If there are many good alternatives; simply choose one randomly.

Randomized Algorithms

□ Ideally:

Runtime should be <u>independent of the specific inputs</u>

No specific input should cause worst-case behavior

 Worst-case should be determined only by output of a random number generator.

Randomized Quicksort

Using Hoare's partitioning algorithm:

```
\begin{aligned} \textbf{R-QUICKSORT}(\textbf{A}, p, r) \\ \textbf{if } p < r \textbf{ then} \\ q \leftarrow \textbf{R-PARTITION}(\textbf{A}, p, r) \\ \textbf{R-QUICKSORT}(\textbf{A}, p, q) \\ \textbf{R-QUICKSORT}(\textbf{A}, q+1, r) \end{aligned}
```

 $\begin{array}{l} \textbf{R-PARTITION}(\textbf{A}, p, r) \\ s \leftarrow \textbf{RANDOM}(p, r) \\ \textbf{exchange A}[p] \leftrightarrow \textbf{A}[s] \\ \textbf{return H-PARTITION}(\textbf{A}, p, r) \end{array}$

Alternatively, permuting the whole array would also work→ but, would be more difficult to analyze

CS 473 – Lecture 6-b

Randomized Quicksort

Using Lomuto's partitioning algorithm:

```
\begin{aligned} \textbf{R-QUICKSORT}(\textbf{A}, p, r) \\ \textbf{if } p < r \textbf{ then} \\ q \leftarrow \textbf{R-PARTITION}(\textbf{A}, p, r) \\ \textbf{R-QUICKSORT}(\textbf{A}, p, q-1) \\ \textbf{R-QUICKSORT}(\textbf{A}, q+1, r) \end{aligned}
```

 $\begin{array}{l} \textbf{R-PARTITION}(\textbf{A}, p, r) \\ s \leftarrow \textbf{RANDOM}(p, r) \\ \textbf{exchange } \textbf{A}[r] \leftrightarrow \textbf{A}[s] \\ \textbf{return } \textbf{L-PARTITION}(\textbf{A}, p, r) \end{array}$

Alternatively, permuting the whole array would also work→ but, would be more difficult to analyze

CS 473 – Lecture 6-b

Notations for Formal Analysis

□ Assume all elements in A[p..r] are distinct
□ Let n = r − p + 1

 $\Box \text{ Let rank}(x) = \{A[i]: p \le i \le r \text{ and } A[i] \le x\}$

i.e. rank(x) is the number of array elements with value less than or equal to x

i.e. it is the 3rd smallest element in the array

CS 473 – Lecture 6-b

Formal Analysis for Average Case

The following analysis will be for Quicksort using Hoare's partitioning algorithm.

- Reminder: The pivot is selected randomly and exchanged with A[p] before calling H-PARTITION
- \Box Let x be the random pivot chosen.
- □ What is the probability that rank(x) = i for i = 1, 2, ..., n? P(rank(x) = i) = 1/n

Various Outcomes of H-PARTITION

Assume that rank(x) = 1

i.e. the random pivot chosen is the smallest element

What will be the size of the left partition (|L|)? <u>*Reminder*</u>: Only the elements less than or equal to x will be in the left partition.

CS 473 – Lecture 6-b

Various Outcomes of H-PARTITION

Assume that rank(x) > 1

i.e. the random pivot chosen is <u>no</u>t the smallest element

What will be the size of the left partition (|L|)?

<u>*Reminder*</u>: Only the elements less than or equal to \mathbf{x} will be in the left partition.

<u>*Reminder*</u>: The pivot will stay in the right region after H-PARTITION if rank(x) > 1

$$\begin{array}{c|c} \bullet & |L| = rank(x) - 1 \\ p & r \\ \hline 2 & 4 & 7 & 6 & 8 & 5 & 9 \\ \end{array} \quad pivot = x = 5 \\ \end{array}$$

CS 473 – Lecture 6-b

Various Outcomes of H-PARTITION - Summary

$\mathbf{P}(\operatorname{rank}(\mathbf{x}) = \mathbf{i}) = 1/n$ for $1 \le \mathbf{i} \le n$	x: pivot
if rank(x) = 1 then L = 1	L: size of left region

if rank(x) > 1 then |L| = rank(x) - 1

P(|L| = 1) = P(rank(x) = 1) + P(rank(x) = 2) P(|L| = 1) = 2/n

$$P(|L| = i) = P(rank(x) = i+1)$$
 $P(|L| = i) = 1/n$

 for 1 < i < n
 for 1 < i < n

CS 473 – Lecture 6-b

CS 473 – Lecture 6-b

Average - Case Analysis: Recurrence

$$T(n) = \frac{1}{n} (T(1)+T(n-1)) \qquad 1$$

$$+ \frac{1}{n} (T(1)+T(n-1)) \qquad 2$$

$$+ \frac{1}{n} (T(2)+T(n-2)) \qquad 3$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$+ \frac{1}{n} (T(i)+T(n-i)) \qquad i+1$$

$$\vdots \qquad \vdots$$

$$+ \frac{1}{n} (T(n-1)+T(1)) \qquad n$$

$$+ \Theta(n)$$

CS473 – Lecture 6-b

Cevdet Aykanat - Bilkent University Computer Engineering Department 13

Recurrence

$$T(n) = \frac{1}{n} \sum_{q=1}^{n-1} (T(q) + T(n-q)) + \frac{1}{n} (T(1) + T(n-1)) + \Theta(n)$$

Note: $\frac{1}{n} (T(1) + T(n-1)) = \frac{1}{n} (\Theta(1) + O(n^2)) = O(n)$
 $\Rightarrow T(n) = \frac{1}{n} \sum_{q=1}^{n-1} (T(q) + T(n-q)) + \Theta(n)$

for k = 1,2,...,n-1 each term T(k) appears twice
 once for q = k and once for q = n-k

•
$$T(n) = \frac{2}{n} \sum_{k=1}^{n-1} T(k) + \Theta(n)$$

CS473 – Lecture 6-b Cevdet Ayka

Solving Recurrence: Substitution

Guess: T(n)=O(nlgn)

I.H.: $T(k) \le ak \lg k$ for k < n, for some constant a > 0

$$T(n) = \frac{2}{n} \sum_{k=1}^{n-1} T(k) + \Theta(n)$$

$$\leq \frac{2}{n} \sum_{k=1}^{n-1} (ak \lg k) + \Theta(n)$$

$$= \frac{2\alpha}{n} \sum_{k=1}^{n-1} (k \lg k) + \Theta(n)$$

Need a tight bound for $\sum k \lg k$

CS473 – Lecture 6-b

Tight bound for $\sum k \lg k$

• Bounding the terms

$$\sum_{k=1}^{n-1} k \lg k \le \sum_{k=1}^{n-1} n \lg n = n(n-1) \lg n \le n^2 \lg n$$

This bound is not strong enough because

•
$$T(n) \le \frac{2\alpha}{n} n^2 \lg n + \Theta(n)$$

= $2an \lg n + \Theta(n)$ \Rightarrow couldn't prove $T(n) \le an \lg n$

CS473 – Lecture 6-b

Tight bound for $\sum k \lg k$

• Splitting summations: ignore ceilings for simplicity

$$\sum_{k=1}^{n-1} k \lg k \le \sum_{k=1}^{n/2-1} k \lg k + \sum_{k=n/2}^{n-1} k \lg k$$

First summation: $\lg k < \lg(n/2) = \lg n - 1$ Second summation: $\lg k < \lg n$

Splitting:
$$\sum_{k=1}^{n-1} k \lg k \le \sum_{k=1}^{n/2-1} k \lg k + \sum_{k=n/2}^{n-1} k \lg k$$

$$\sum_{k=1}^{n-1} k \lg k \le (\lg n-1) \sum_{k=1}^{n/2-1} k + \lg n \sum_{k=n/2}^{n-1} k$$
$$= \lg n \sum_{k=1}^{n-1} k - \sum_{k=1}^{n/2-1} k = \frac{1}{2} n(n-1) \lg n - \frac{1}{2} \frac{n}{2} (\frac{n}{2} - 1)$$
$$= \frac{1}{2} n^2 \lg n - \frac{1}{8} n^2 - \frac{1}{2} n(\lg n - 1/2)$$
$$\sum_{k=1}^{n-1} k \lg k \le \frac{1}{2} n^2 \lg n - \frac{1}{8} n^2 \quad \text{for } \lg n \ge 1/2 \Rightarrow n \ge \sqrt{2}$$

CS473 – Lecture 6-b

Cevdet Aykanat - Bilkent University Computer Engineering Department 18

Substituting:

$$\sum_{k=1}^{n-1} k \lg k \le \frac{1}{2} n^2 \lg n - \frac{1}{8} n^2$$

$$T(n) \leq \frac{2a}{n} \sum_{k=1}^{n-1} k \lg k + \Theta(n)$$

$$\leq \frac{2a}{n} (\frac{1}{2}n^2 \lg n - \frac{1}{8}n^2) + \Theta(n)$$

$$= an \lg n - \left(\frac{a}{4}n - \Theta(n)\right)$$

We can choose *a* large enough so that $\frac{a}{4}n \geq \Theta(n)$
$$\Rightarrow T(n) \leq an \lg n \Rightarrow T(n) = O(n \lg n) \quad \text{Q.E.D.}$$

CS473 – Lecture 6-b
