## Input/Output Functions

Selim Aksoy Bilkent University Department of Computer Engineering saksoy@cs.bilkent.edu.tr

# MATLAB Basics: Data Files save filename var1 var2... ave homework.mat x y → binary ave x.dat x -asci → asci load filename.mat → binary load x.dat -asci → asci

## The textread Function

- The textread function skips the columns that have an asterisk (\*) in the format descriptor
  - [fname, phone] = textread('phones.txt', '%s %\*s %\*s %d')
- The load command (with ASCII option) assumes all of the data is of a single type but textread is more flexible

## **Opening Files Opening Files** Permission can be: Examples: 'r': open file for reading (default) • 'w': open file, or create a new file, for writing; discard existing contents, if any • 'a': open file, or create a new file, for writing; append data to the end of the file 'r+': open file for reading and writing 'w+': open file, or create a new file, for reading and writing; discard existing the end) contents, if any Fall 2004 Fall 2004; a+': open file, or create a new file, for CS 111

- fid = fopen( 'example.dat', 'r' ) opens a binary file for input
- fid = fopen( 'example.dat', 'wt') opens a text (ASCII) file for output (if example.dat already exists, it will be deleted)
- fid = fopen( 'example.dat', 'at' ) opens a text file for output (if example.dat already exists, new data will be appended to

## Writing Formatted ASCII Data

- count = fprintf(fid,format,val1,val2,...) writes formatted ASCII data in a userspecified format
  - fid: file id (if fid is missing, data is written to the standard output device (command window)
  - format: same as what we have been using (combination of format specifiers that start with %)

14

• count: number of characters written

## Writing Formatted ASCII Data

- Make sure there is a one-to-one correspondence between format specifiers and types of data in variables
- Format strings are scanned from left to right
- Program goes back to the beginning of the format string if there are still values to write (format string is recycled) (not recommended)
- If you want to print the actual % character, you can use %% in the format string
